9.Python program to implement DFS (Depth-First Search)

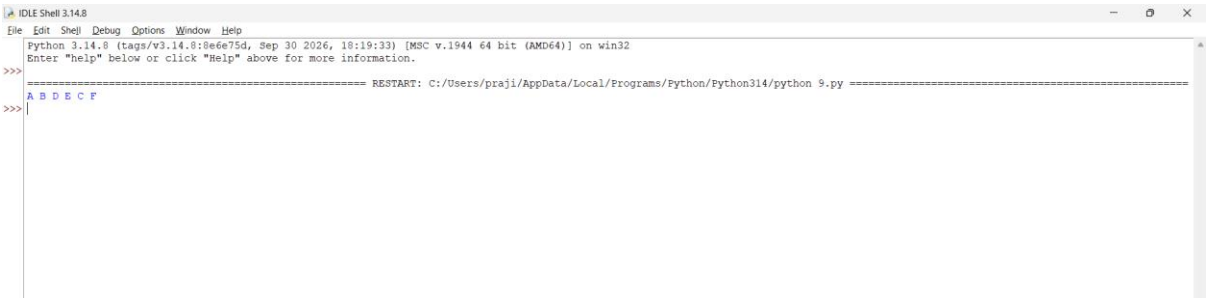

Aim: To implement Depth-First Search to traverse a graph by exploring one path as deeply as possible.

Algorithm:

1. Start from the initial node.
2. Mark the node as visited and display it.
3. Visit an unvisited neighboring node.
4. Continue until no unvisited neighbors remain.
5. Backtrack and explore other paths.

Program:

Result: Thus, the DFS program was implemented and executed successfully.
